

Doctor-Client Portal Vision Statement

The Doctor-Client Portal will be an integrated system to maintain and communicate important information between doctors and clients such as client records, doctors appointments and client prescriptions. Like a personal assistant it will remind both doctors and clients of upcoming appointments, pull up clients records for doctors and recommend doctors for client to see.

The system is primarily designed for both doctors and clients. For doctors, it helps them to easily and seamlessly manage clients efficiently. The application will give doctors the ability to group clients according to their needs, reassign them to a different doctor if necessary and provide clients with advice through a messaging system.

For clients, the system enables them to get the best possible doctor to attend to their needs, as well as get medical advice from professionals without having to leave the comfort of their house.

This system will be a significant improvement over any current systems in use, which just provides users with contact information of doctors, or systems that just keep records of clients. The proposed Doctor-Client Portal will not only keep records of both doctors and clients both maintain a channel of communication between both parties, enabling them to make the best possible decisions.

This system will be considered successful if the users (clients/doctors) prefer this system over any current system that handles doctor-client information, when clients are just a click away from getting medical information and advice from a professional, and doctors are able to manage and advise their clients seamlessly through the system.
